TABEX™

A modern and reliable method for giving up smoking

Tabex is an original Bulgarian preparation of plant origin, intended for the treatment of tobacco smoking. The preparation is developed on the basis of the alkaloid CYTISIN, contained in the plant Cytisus laburnum - Goldenchain Acacia.

Cytisin possesses a structure and mechanism of action that are similar to those of nicotine, but it has much lower toxicity.

In human organism, cytisin plays the role of a nicotine substitution substance, and reduces the period of interaction of the received nicotine with the relevant nicotine receptors, i.e. the specific substance cytisin „substi-

tutes“ nicotine, acting on the same receptors, thus preventing the appearance of an abstinence syndrome. This results in a gradual reduction and suspension of the psychic and physical dependency to nicotine in smokers.

The broad clinical studies carried out, show that the therapy with the preparation **Tabex** results in giving up smoking in more than 57% of the patients.

Tabex manifests one of the best results to date for the group of preparations, intended for tobacco smoking therapy.

Tabex is very well tolerated, and when applied in therapeutic doses, allows a gradual giving up of smoking without any side effects.

Recommended therapeutic scheme

1-3 day	1 tablet each 2 hours	▶	6 tablets daily
4-12 day	1 tablet each 2.5 hours	▶	5 tablets daily
13-16 day	1 tablet each 3 hours	▶	5 tablets daily
17-20 day	1 tablet each 4 hours	▶	3 tablets daily
21-25 day	1 tablet each 6 hours	▶	2 tablets daily
